

Smart Air Distribution

The **Air Inlet Doors** from VAL-CO® are designed and engineered to provide an economical means of air distribution in a mechanically ventilated barn.

Tunnel doors can be installed continuously or individually between knee braces.

Our framed inlet doors are completely sealed to keep destructive bugs and rodents away from foam.

- Tunnel inlet doors have about 7x the insulation value of curtains, they reduce cold zones during winter that cause heaters to use more gas.
- Our Tunnel Inlet Doors have internal wooden stiffeners for added reinforcement, and an extra large continuous seal along the top and ends to seal out drafts.
- Our Framed Inlet Doors feature all vinyl construction, are foam insulated with flexible door seals, and a full-length polymer hinge.
- Door and seal directs air up along ceiling.
