

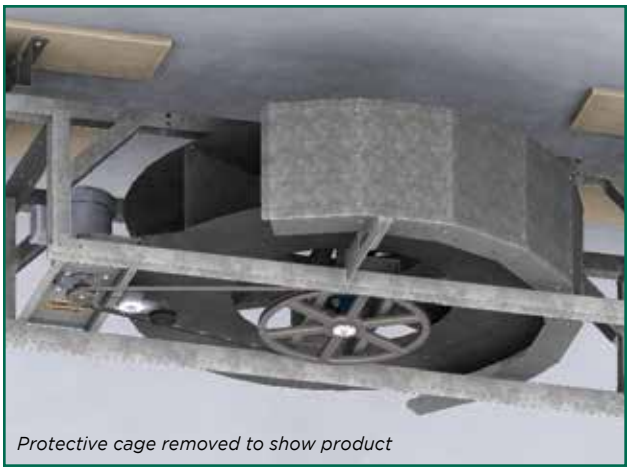
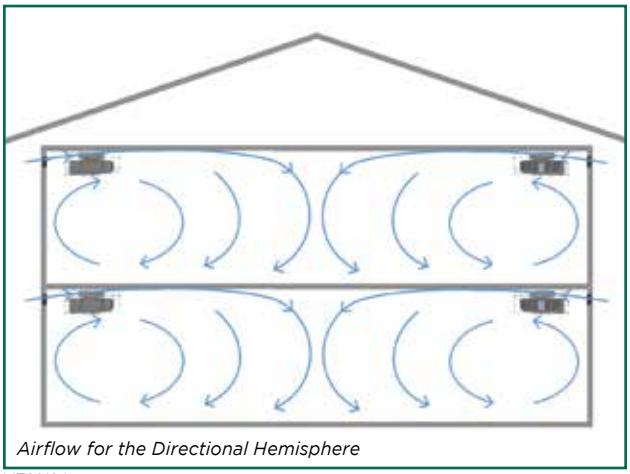
Ventilate Wide Buildings

The **Directional Hemisphere Fan** uses proprietary technology for whole house air mixing by working in conjunction with sidewall inlets to easily ventilate wide houses.



Protective cage removed to show product



Airflow for the Directional Hemisphere

- Directional shroud diverts mixing air from the hemisphere away from the sidewall, working in concert with sidewall inlets.
- Installs offset from the ceiling to allow air from sidewall inlets to flow to the center of the house.
- Two sizes, 48” and 72” diameters, cover a wide range of applications.
- Mixes the warmest air in the house with fresh outside air before contacting the birds; significantly reducing drafts and cold zones during minimum ventilation.
